# Prostate Problems

**No surgery.  
Just relief.**

As men age many will suffer from urinary problems caused by an enlarged prostate. This common condition, called benign prostatic hyperplasia (BPH), can be easily treated with Prostate Artery Embolization (PAE). PAE is a minimally invasive procedure proven to provide symptom relief and improve urinary flow rates in many patients.

## Benefits of PAE.

**No urinary catheter or hospital stays needed for PAE!** It is a minimally invasive procedure completed in our office.

**Fewer risks and less expensive** than traditional surgery.

**PAE has a shorter recovery time and preserves sexual function.**

Most patients resume normal activities within 3-4 days and begin to experience relief within a few weeks.

## How does PAE work?

PAE is performed without the risks associated with invasive surgery by our interventional radiologists subspecialty trained in vascular procedures. We use moderate sedation to keep you comfortable, while our doctor navigates a tiny catheter from an artery in your groin or wrist to the arteries supplying blood flow to the prostate. Tiny beads are then used to block the blood flow to the enlarged prostate, resulting in decreased size of the prostate. PAE has been proven to decrease and relieve the symptoms of BPH.

## Is PAE for YOU?

PAE may be a suitable option if you have moderate to severe benign prostatic hyperplasia (BPH) symptoms and have not found relief from conservative treatments like medications and prefer a non-surgical solution.

## The Clarity Care difference.

Our team will collaborate with you to develop a personalized treatment plan and support you throughout the entire process, ensuring a comfortable and positive experience. To learn more or to schedule a consult please call **913.944.4900**.
